

RaceSync

One race. Two worlds.

**Bringing a global virtual grid to the Viola Private Wealth Sydney 300 —
racing the real field, live, under one MRA permit.**

A proposal for **Terry & Motor Racing Australia**

The shift happening around us

- **Sim racing is now mainstream** — tens of millions of players, huge online audiences, and a generation of fans who compete from home.
- **Real-world club motorsport** fights rising costs, ageing grids, and limited reach.
- These two worlds barely touch — yet they share the same circuits, the same rules, and the same love of racing.

| What if your event could run both at once — and own the bridge between them?

The idea, in one line

A field of **real cars** races the Sydney 300 at Sydney Motorsport Park.

A field of **remote sim racers** races **the same race, at the same time**, against live digital twins of your real cars — scored as their **own class**, under the **same MRA permit**.

RaceSync is the technology that makes the two fields one event.

How it works (no new burden on your operation)

Real world (you already run this)	RaceSync adds
MyLaps timing & transponders	reads your live timing/GPS
Zello MRA-RMC race-management channel	relays your <i>one</i> race-control voice to virtual drivers too
Safety Car procedures	becomes Code 60 for the virtual field, automatically
Race Control & Clerk of Course	one extra operator console beside Race Control

The real cars are streamed into the simulator as moving cars. Virtual drivers see them, race them, and hear your officials — **one race, one set of rules**.

What's in it for MRA

- **New revenue** — entry fees from a virtual grid, plus fresh **sponsor inventory** (virtual-class naming, in-sim branding, streaming overlays).
- **A bigger audience** — your event reaches the global sim-racing community and streams natively to Twitch/YouTube.
- **A standout story** — a **hybrid real/virtual enduro is genuinely novel**; it earns media and sets MRA apart from every other organiser.
- **Future-proofing** — whether the Sydney 300 stays physical, goes hybrid, or one day runs virtual-only, **RaceSync owns that transition** for you.

Safe and fair by design

- **Virtual cars can never touch a real car or driver** — the crossover is one-way: sim racers see the real field, the real field races as normal.
- **Safety Car → Code 60**: when you neutralise the real race, the virtual field slows to 60 km/h, no overtaking — fairness preserved on both sides.
- **Separate class, transparent scoring** — real and virtual cars are timed and classified independently, with a full audit trail; your official MyLaps result is never overridden.
- **Timed finish** — virtual cars take the chequer the instant your real leader completes 300 km, so both fields finish together.

This isn't a concept deck — it already runs

- A **working software platform** is built and tested today: live timing/GPS ingestion, race-state sync (green / Code 60 / timed finish), the race-audio bridge, and combined real-vs-virtual scoring — **100+ automated tests, continuous integration**.
- We can already **simulate the full Sydney 300 field** and drive it into a simulator.
- **Honest about the hard part:** putting real cars *inside* the sim is the frontier we're validating now — and there's a **guaranteed fallback** (a synced virtual race + live combined timing/track-map) so **the event is never hostage to unproven tech**.

The driver & fan experience

- Virtual drivers race **collidable** digital twins of your real cars — real wheel-to-wheel, not ghosts (precision scales with RTK GPS).
- Everyone hears **the same Race Control** — your **MRA-RMC** voice, in their headset.
- A **combined live timing screen** and track map show both fields together — ready-made **broadcast** content.

Low-risk rollout

1. **Pilot (off-track):** prove the data path on recorded laps — no event impact. (*done / in progress*)
2. **Test day at SMSP:** a few cars fitted with GPS; validate accuracy & latency on the real circuit.
3. **Dress rehearsal:** small virtual grid against a practice session.
4. **Event:** virtual class runs alongside the Sydney 300, scored under the permit.

At every step there's a **working fallback**, so we only ever *add* to your event.

What we'd need from MRA

- **Your blessing to run a pilot** around the Sydney 300.
- Access, on commercial terms, to: the **MyLaps X2 timing feed**, the **MRA-RMC Zello channel**, and a **test session** at SMSP.
- A joint conversation with **Motorsport Australia** about permitting a concurrent virtual class and the Code 60 procedure.

We bring the technology, the build, and the operating crew.

The Sydney 300, reimagined

Same circuit. Same rules. Same race control.

A grid that now spans the world.

Let's run a pilot and show what a hybrid Sydney 300 looks like.

RaceSync — one race, two worlds.
