

RaceSync

One race. Two worlds.

A global virtual grid, racing your real field — live, under one MRA permit.

Trial it at the **Wakefield 300**. Scale it to the **Sydney 300**.

A proposal for Terry & Motor Racing Australia

The shift happening around us

- **Sim racing is now mainstream** — tens of millions of players, big online audiences, a generation who compete from home.
- **Club motorsport** fights rising costs, ageing grids, and limited reach.
- They share the same circuits, the same rules, the same love of racing — but barely touch.

MRA can own the bridge between them — and be first to do it.

| The idea, in one line

Your **real SuperTT field** races the enduro at the circuit.

A field of **remote sim racers** races **the same race, at the same time**, against live digital twins of your real cars — scored as their **own class**, under the **same MRA permit**.

RaceSync is the technology that makes the two fields one event.

How it works — no new burden on your operation

You already run this	RaceSync adds
MyLaps timing & transponders	reads your live timing / GPS
Zello MRA-RMC race-management channel	relays your <i>one</i> race-control voice to virtual drivers too
Safety Car procedures	becomes Code 60 for the virtual field, automatically
Race Control & Clerk of Course	one extra operator console beside Race Control

Real cars stream into the simulator as moving cars. Virtual drivers see them, race them, and hear your officials — **one race, one set of rules.**

What's in it for MRA

- **New revenue** — entry fees from a virtual grid, plus fresh **sponsor inventory** (virtual-class naming, in-sim branding, streaming overlays).
- **A bigger audience** — your events reach the global sim-racing community and stream natively to Twitch / YouTube.
- **A season, not a one-off** — a virtual class can run across **all 8 rounds and the three 300 km enduros** (Wakefield 300, Shelley 300, Sydney 300).
- **A standout story** — a hybrid real/virtual enduro is **genuinely novel**; it earns media and sets MRA apart from every other organiser.

Safe and fair by design

- **Virtual cars can never touch a real car or driver** — the crossover is one-way: sim racers see the real field; your real field races as normal.
- **Safety Car → Code 60** — when you neutralise the real race, the virtual field drops to 60 km/h, no overtaking. Fairness preserved on both sides.
- **Separate class, transparent scoring** — real and virtual cars are timed and classified independently, with a full audit trail; your official MyLaps result is never overridden.
- **Timed finish** — virtual cars take the chequer the instant your real leader completes the distance, so both fields finish together.

This isn't a concept — it already runs

- A **working, tested platform** today: live timing/GPS ingestion, race-state sync (green / Code 60 / timed finish), the race-audio bridge, and combined real-vs-virtual scoring — **100+ automated tests, continuous integration.**
- We can already **simulate a full SuperTT field** and drive it into a simulator.
- **Honest about the frontier:** putting real cars *inside* the sim is what we're validating now — with a **guaranteed fallback** (a synced virtual race + live combined timing and track-map), so **the event is never hostage to unproven tech.**

The driver & fan experience

- Virtual drivers race **collidable** digital twins of your real cars — real wheel-to-wheel, not ghosts (precision scales with RTK GPS).
- Everyone hears **the same Race Control** — your **MRA-RMC** voice, in their headset.
- A **combined live timing screen** and track map show both fields together — ready-made **broadcast** content for the stream.

Trial it at the Wakefield 300

The 2026 calendar is the perfect proving ground — low stakes first, flagship last:

Step	Event	When	Role
Trial	Wakefield 300 · One Raceway	28 Feb – 1 Mar 2026	first live run, a few GPS-fitted cars
Iterate	Shelley 300 + selected rounds	across the season	refine, grow the virtual grid
Flagship	Sydney 300 · SMSP	season showcase	full hybrid event, broadcast

You've **already aligned with Motorsport Australia for 2026** — so the sanctioning conversation for a virtual class starts from an existing relationship, not a cold call.

Low-risk rollout

1. **Pilot (off-track):** prove the data path on recorded laps — zero event impact. (*in progress*)
2. **Wakefield 300 test:** a few cars fitted with GPS; validate accuracy & latency on a real circuit.
3. **Dress rehearsal:** a small virtual grid against a practice session.
4. **Event:** the virtual class runs alongside the enduro, scored under the permit.

At every step there's a **working fallback** — we only ever *add* to your event.

What we'd need from MRA

- Your blessing to run the Wakefield 300 trial.
- Access, on commercial terms, to: the MyLaps X2 timing feed, the MRA-RMC Zello channel, and a test session.
- A joint conversation with Motorsport Australia about permitting a concurrent virtual class and the Code 60 procedure.

We bring the technology, the build, and the operating crew.

NSW's premier series — now racing two worlds

Same circuits. Same rules. Same race control.

A grid that spans the globe.

Let's run the Wakefield 300 trial and show what a hybrid MRA enduro looks like.

RaceSync — one race, two worlds.
